

GENERAL APPLICATION INSTRUCTIONS

- Apply prior to or during periods of active growth. Early Spring to Early Summer.
- Rainfall carries the chemical down into the root zone where it is absorbed by the plant's root system. Results will appear 3-6 weeks after 1/4" to 1/2" of rain.
- Do not mow or cut treated plants until they have completely defoliated at least once, or in the case of cedar, have turned completely brown.
- When treating re-growth from cut off plants, the re-growth must be at least one year old and the rate of application based on the original plant size.
- On soils high in clay and/organic matter, use the higher rates.

General

SINGLE STEM PLANTS: For plants with a single stem or trunk such as Oak, Elm and Cedar apply 1-2 pellets for every inch of stem diameter. When more than one pellet is needed, distribute the pellets uniformly around the stem out approximately half way between the stem and canopy edge.

MULTI-STEMMED PLANTS: For multi-stemmed plants such as Mesquite, Huisache and Multiflora Rose that are 2ft to 3ft tall, apply 1-2 pellets at the base of the plant. For plants 3ft to 6ft tall, apply 2-4 pellets at the base of the plant. For Red Berry Cedar (Juniper) apply 1-2 pellets for every 3ft of plant height or every 3ft of canopy diameter, whichever is greater. Apply pellets uniformly around the plant approximately halfway between the plant's stem and canopy edge.

FENCE LINE TREE AND BRUSH CONTROL: For the control of trees and brush in Pasture and Rangeland fences, apply 1 pellet in the fence line for every 3ft of fence length. For heavy infestations, double the rate to 1 pellet for every 1.5 ft of fence length.

Species Specific

RED CEDAR TREES - apply 1 to 2 pellets for every inch of stem (trunk) diameter. Distribute the pellets uniformly around the trunk, approximately half way between the trunk and the canopy edge.

REDBERRY & BLUEBERRY CEDAR - multi-stemmed cedar plants, apply 1 to 2 pellets for every 3 feet of plant height or every 3 feet of canopy diameter, whichever is greater. If plant size requires more than one pellet, space uniformly around the plant approximately half way between the plant's stems and the canopy edge.

MESQUITE AND HUISACHE - multi-stemmed plants, 2' to 4' tall, use 1 to 2 pellets. For 4' to 6' tall plants, use 2 to 4 pellets. Apply the pellets by hand to the ground at the base of the plant.

MESQUITE TREES - apply 2 pellets for every inch of stem (trunk) diameter. Distribute the pellets uniformly around the trunk, approximately half way between the plant's stem and the canopy edge.

YUCCA - apply 1 to 2 pellets directly into the center of the plant or on the ground near the stem. On large plants, apply 2 pellets.
